Specification for the modelling work required for DCP189

The EDCM model needs to be modified to reduce the Fixed charge for eligible EHV customers who made a capitalised O&M payment when they connected to the DNOs network and the period over which the payment was capitalised remains unexpired.

The decision on whether a EHV customer is eligible for the discount will be taken outside of the EDCM model and the implementation of the reduction will be identified by the DNO entering a flag into the model.

To enable this change the following amendments to the EDCM model are required:

- On Sheet 913 (LRIC) and Sheet 911 (FCP), an additional Column will be added "Percentage of sole use assets where Customer is entitled to reduction for capitalised O&M" with the possible input of a value between 0% and 100%"Y" or "N"
- Where the column has a value greater than 0%flag is set to "Y" for a EHV customer the calculation of the fixed charge (import only) will be calculated as follows for that proportion (the remaining percentage will be calculated using the current methodology):

Import fixed charge on Sole Use Assets = network rates charging rate * SUA MEAV
